

**Walkr** is an urban walking app designed to encourage users to both explore new cities and keep track of the landmarks/important locations they saw along the way. The idea is to combine a walk tracking app like Strava with the flexibility of saving locations like in Google Maps. Walkr also allows you to add notes to different locations and attach images, offering flexibility that is not available within alternatives in the App Store. It is an iPhone application and should only be used in Portrait mode. Technically, the app leverages the phone's GPS to collect location data during the user's walks and uses Core Data and User Defaults for local storage.
